TryHackMe Writeup: Linux Fundamentals (Part 1)

Field	Details
Name	Harini Edward
Intern ID	DG/15/OCT/CYBER/040
Program	DG Interns Hub, Week 1
Room	Linux Fundamentals (Part 1)
Room link	https://tryhackme.com/room/linuxfundamentalspt15vmpa?utm_campaign=social_share&utm_medium=social&utm_content=share-completed-room&utm_source=copy&sharerId=698d81bc7977c1741b32e1c8
Estimated time	15 min
Status	Completed (100%)

Objective

Get comfortable with the Linux command line by running the first essential commands on an interactive terminal.

What I did, task by task

Background on Linux

- Linux is an open source operating system used in servers, cloud, embedded devices and most security tools.
- There are many distributions (Ubuntu, Debian, Kali and so on) built on the same kernel.

Running first commands

- Used echo to print text and whoami to see the current user.
- Used ls to list files, cd to move between folders, cat to read a file and pwd to see the current path.

Searching for files

- find searches for files by name or other conditions.
- grep searches for text inside a file, which is very handy with large logs.

Shell operators

- & runs a command in the background and && runs the second command only if the first one succeeds.
- > writes output to a file (overwriting it) and >> appends to the end of it.

Working with the filesystem

- Created and handled files and folders with touch, mkdir, cp, mv and rm, and used file to check a file's type.

Commands and tools used

Command / Tool	What it does
echo / whoami	Print text / show current user
ls, cd, pwd	List files, change directory, show current path
cat	Display file contents
find	Search for files and folders
grep	Search for text inside files
touch, mkdir	Create a file / create a folder
cp, mv, rm	Copy, move or rename, delete
file	Show the type of a file
> and >>	Redirect output to a file (overwrite / append)

Key takeaways

- Almost everything in Linux can be done from the terminal.
- find and grep are the two commands I'll use most for investigations.
- > overwrites and >> appends, so it's important to pick the right one.
- Be careful with rm, because there is no recycle bin.

Why this matters for a SOC role

Most SIEM agents, servers and forensic tools run on Linux. Reading logs with grep and navigating the system quickly is a day-to-day skill for a SOC analyst or incident responder.

Proof of completion
