Security Solutions

DG Interns Hub - Week 3 | **Name: Harini E | Intern ID: DG/15/OCT/CYBER/040**

Platform	LetsDefend (free course)
Course	Security Solutions
Completed on	06 November 2026, 09:48 AM
Status	Completed and badge earned

Overview

This course walks through the security solutions a SOC works with every day, one lesson per solution, from detection and prevention tools to email and web protection. It ends with hands-on questions on a log from an email security solution. I took it because it ties together several things from this week: the IDS and IPS lesson relates to my Snort work, and the EDR lesson relates to the endpoint data I collected with Sysmon and auditd.

Lessons in the course

Lesson	In short
Intrusion Detection System (IDS)	Watches traffic and raises an alert when something looks suspicious.
Intrusion Prevention System (IPS)	Like an IDS, but it can also block the suspicious traffic.
Firewall	Allows or blocks traffic based on rules.
Endpoint Detection and Response (EDR)	Monitors activity on endpoints and helps investigate and respond.
Antivirus Software (AV)	Detects and removes known malware on a machine.
Sandbox Solutions	Runs a suspicious file in an isolated environment to see what it does.
Data Loss Prevention (DLP)	Helps stop sensitive data from leaving the organisation.
Asset Management Solutions	Keeps track of the devices and software in the environment.
Web Application Firewall (WAF)	Protects web applications from attacks.
Load Balancer	Spreads traffic across several servers.
Proxy Server	Sits between users and the internet, and can filter and log requests.
Email Security Solutions	Checks email for spam, phishing and malware.

Hands-on questions I answered

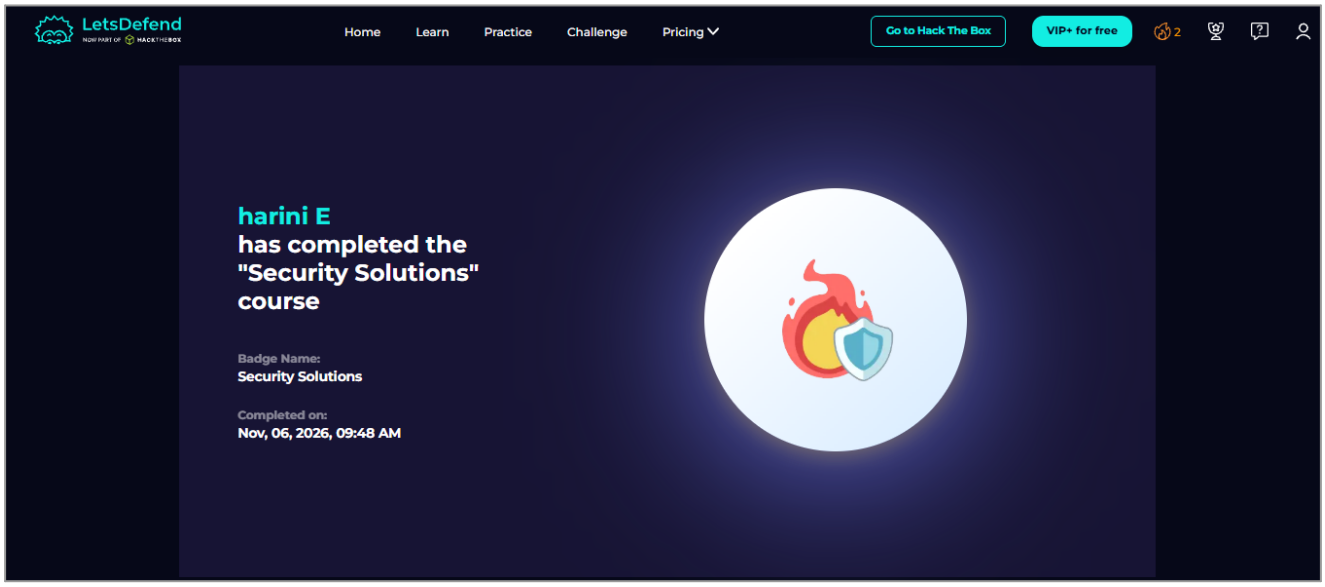

For the Email Security Solutions lesson, I used the email.log.zip file that the lab provides and answered two questions.

Question	My answer	Result
According to the email security solution log, what is the email address of the recipient of the email?	jonas@letsdefend.io	Correct
What is the type of threat according to the email security solution log provided?	malware	Correct

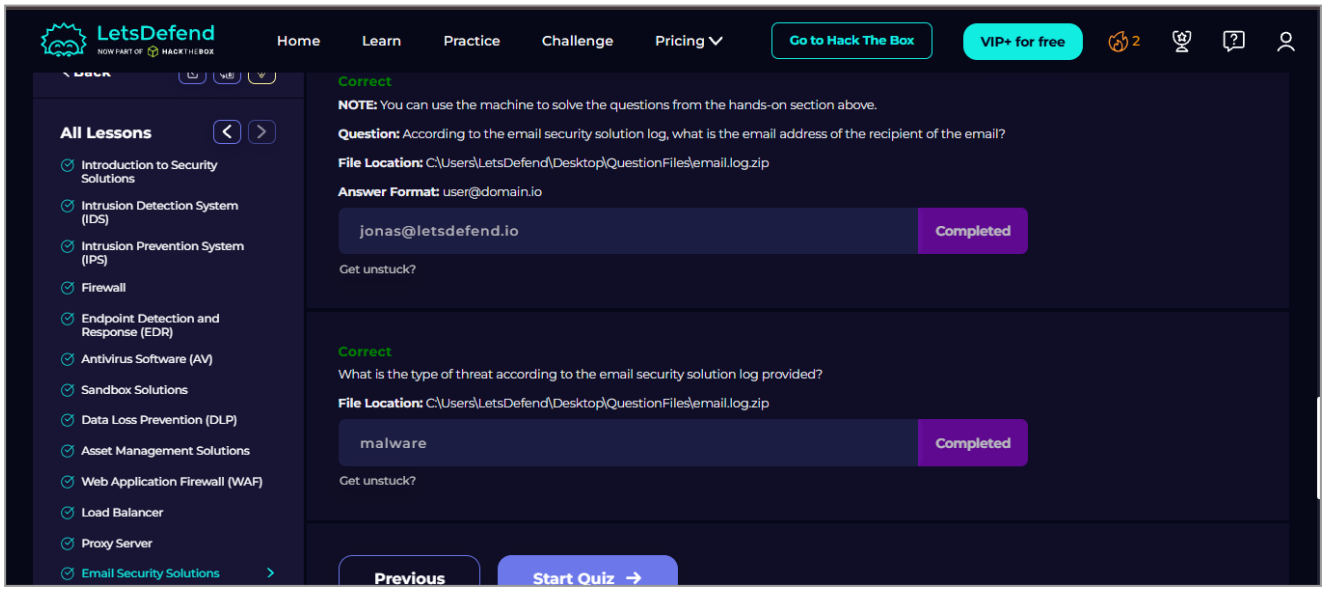

What I took from it

An email security log gives an analyst the recipient and the type of threat, so it is possible to see quickly who received a malicious email and what kind of threat it carried. Going through the lessons also showed me how each solution has a different job, and that a SOC needs several of them working together, since no single tool covers everything.

Evidence

1. Badge page showing the Security Solutions course completed on 06 November 2026, 09:48 AM

2. Lesson list with the lessons checked, and my two correct answers on the Email Security Solutions questions
