LetsDefend Writeup

SIEM 101

DG Interns Hub - Week 3 | **Name: Harini E | Intern ID: DG/15/OCT/CYBER/040**

Platform	LetsDefend (free course)
Course	SIEM 101
Completed on	06 November 2026, 10:05 AM
Status	Completed, quiz taken and badge earned

Overview

SIEM 101 is an introduction to how a SIEM works, following the path of a log from the source to an alert. It fits directly with this week, because the log ingestion flow I wrote about in my theory notes, from log source to SIEM dashboard, is the same path this course explains step by step.

Lessons in the course

Lesson	In short
SIEM Introduction	What a SIEM is and what it is used for.
Log Collection	How logs are gathered from different sources.
Log Aggregation and Parsing	Bringing logs together in one place and turning them into structured fields that can be searched.
Log Storage	How logs are kept so they can be searched later.
Alerting	How a SIEM raises an alert when something matches a rule.
SIEM (Quiz)	A quiz to check what I learned from the course.

Questions I answered

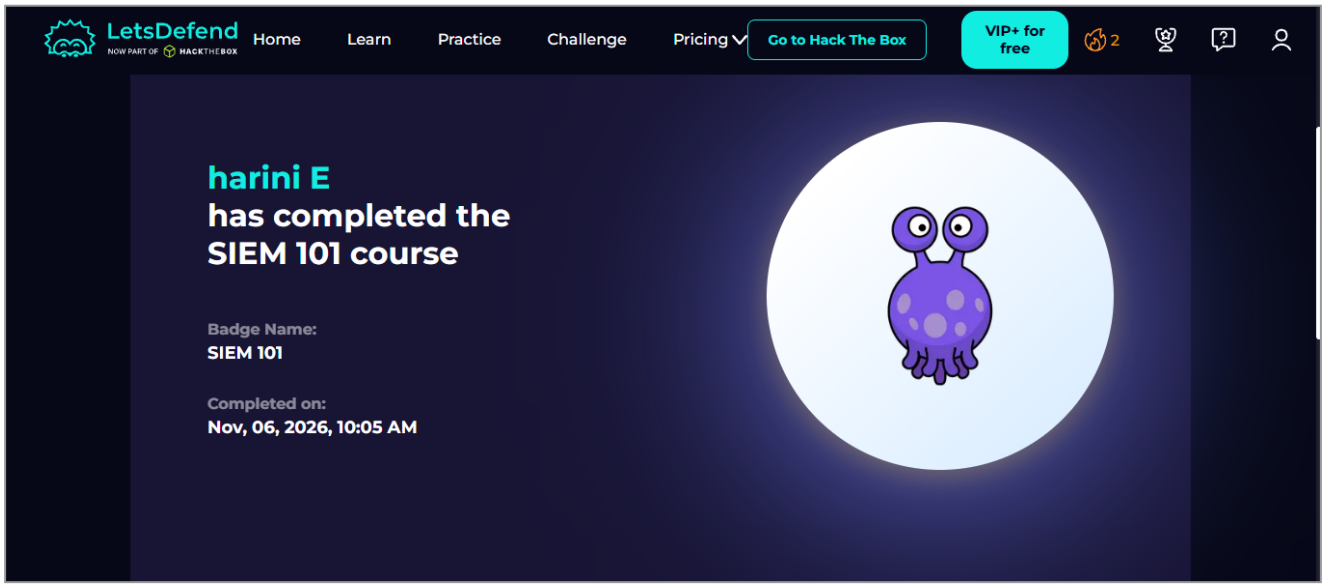

These two questions came from the Alerting lesson.

Question	My answer	Result
There are two IP addresses that are definitely malicious. Which method should be used to create an alert when these IP addresses are accessed? (Whitelisting, Blacklist or Long tail)	blacklist	Correct
"The whitelist method is effective and easy to manage." Is this statement true or false?	false	Correct

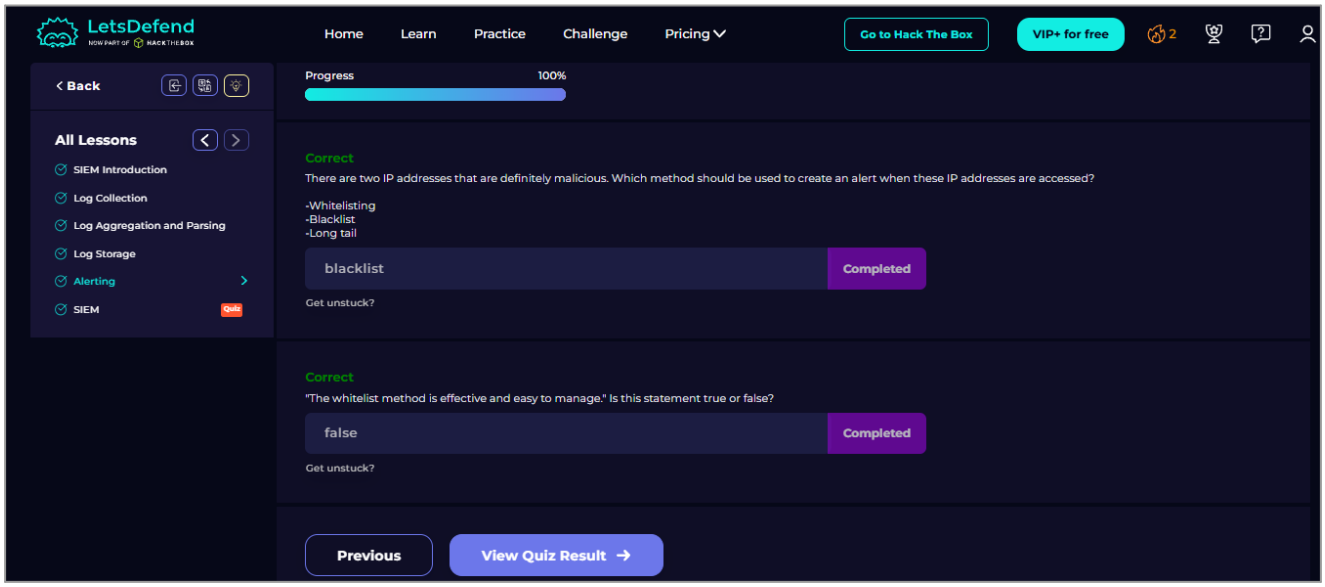

What I took from it

When the malicious IP addresses are already known, a blacklist is the method to alert on them. The second question showed me that a whitelist is not an easy method to manage, so I should not treat it as the simple answer. Following the lessons in order also helped me see that an alert is only as good as the logs collected and parsed before it.

Evidence

1. Badge page showing the SIEM 101 course completed on 06 November 2026, 10:05 AM

2. Lesson list with all lessons checked, progress at 100%, and my two correct answers in the Alerting lesson
