TryHackMe Writeup

Intro to Logs

DG Interns Hub - Week 3 | **Name: Harini E | Intern ID: DG/15/OCT/CYBER/040**

Platform	TryHackMe (free room)
Room	Intro to Logs
Level	Easy
Room time	30 min (as shown on the room page)
Status	Completed, the room progress bar shows 100%
Room link	https://tryhackme.com/room/introtologs

Overview

This room introduces the basics of logging: what logs are, where they come from and how they are collected and managed. A log is a record of something that happened on a system, so logs act as evidence of past activity. It is the starting point for log analysis, and it supports this week's work, because Sysmon, auditd and Snort all create logs that later reach a SIEM.

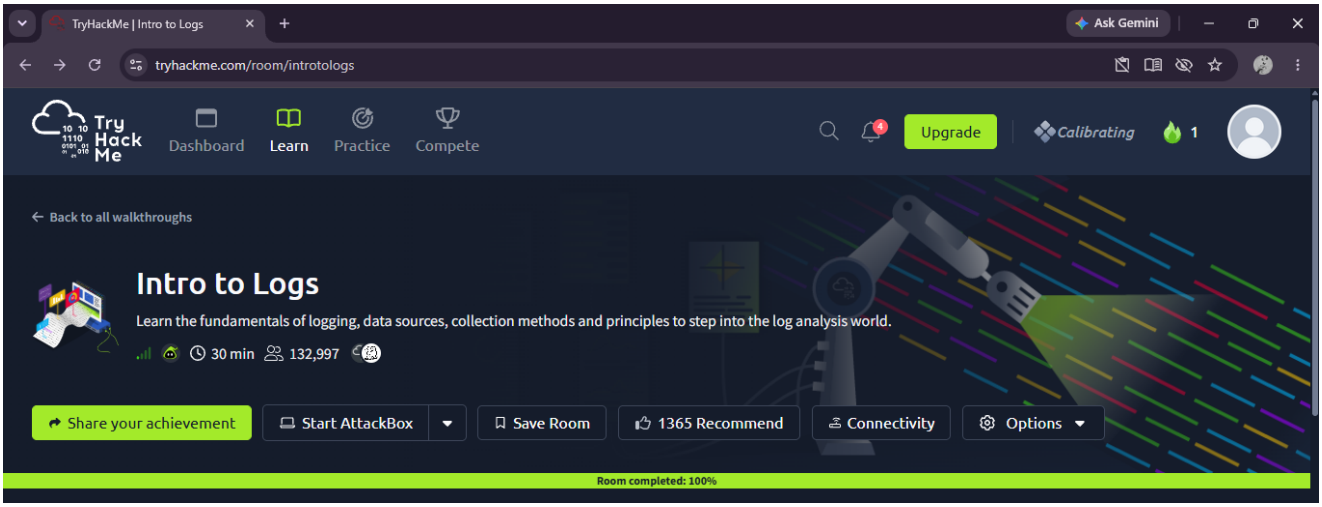

Topics I completed

Topic	Focus
Logs as evidence	Logs are records of historical activity, and many traces of an attack can be found in them.
Types of logs	Different sources create different logs, such as system, application, security, audit, network and web server logs.
Log formats and standards	Logs follow different formats, so an analyst has to understand the format before reading the data.
Collection	Logs are gathered from servers, devices and applications. The room has a practical activity that uses rsyslog to collect SSH logs.
Management and centralisation	Logs are kept in one central place, and clocks are synchronised so that events from different machines can be put in the right order.
Storage, retention and deletion	A plan is needed for how long logs are kept and when they are removed. logrotate is used to manage log files.
Analysis tools	Command line tools help with simple searches, and SIEM tools such as Splunk or Elastic are used for large amounts of data.

What I took from it

The room showed me that logging is more than just saving files. Logs are only useful if the right sources are collected, the time on every machine is correct, and the logs are kept long enough to investigate later. The idea of collecting logs from many sources into one place is the same flow I studied in my theory notes on how Wazuh and Splunk bring endpoint and network logs into a SIEM.
